1. **Follow step 1A to 1E can be done simultaneously.**

2. **Assemble everything together as shown in step 1C .**

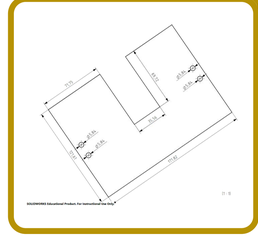

1A

Building the case out of poplar wood for the candy machine with the given tutorial (qr-code) & change the following things:

- **Electronics:** you only need a servo motor & nothing else mentioned in the tutorial
- Either close one hole in the CAD file for the 3d printed model (Recommended) or cut an extra piece out of your poplar wood to close the second hole, as we did in this project (see image x, arrow y)
- The dimensions of the hole in which the servo motor is mounted, must be adjusted to fit the dimensions of the servo motor being used
- Color the case red with acrylic paint
- Use additional nuts to arrange the height of the 3d printed part (and if used, the extra piece of poplar wood arrow y), depending on your servo motor and crystal bowl
- Add a post it note with the text in Appendix xyz

The Return of the secret knock gumball machine

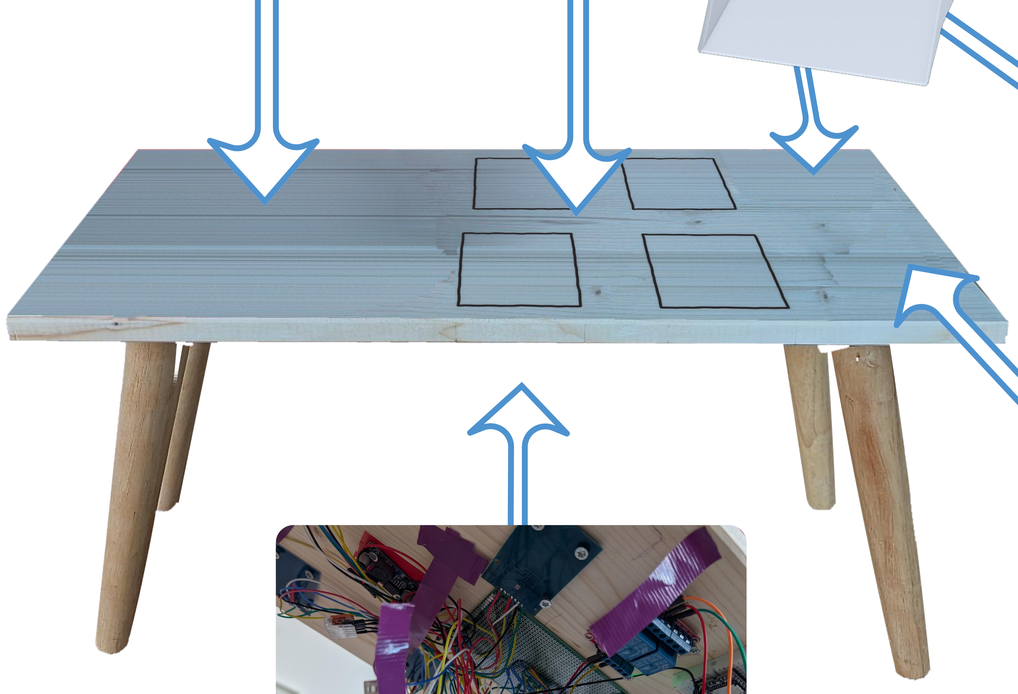

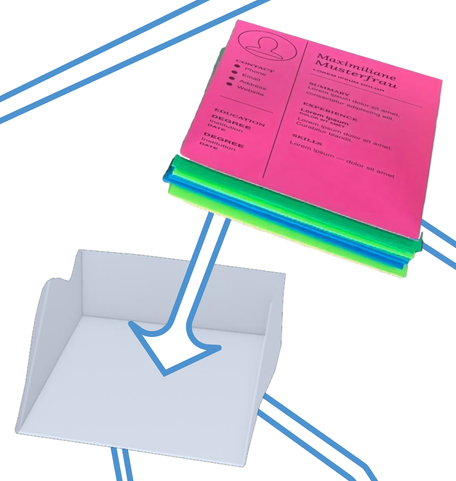

2 Assemble everything together

1B Building a mini table

1. We removed the legs from an old stool and attached them to a wooden board (30x80 cm).
2. Use a soldering iron, to burn rectangles (A cm x Acm) into the wood on the top of the table

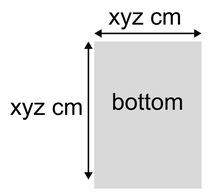

1C Print out the CV's from appendix xyz & stick one nfc tag at the back of each paper

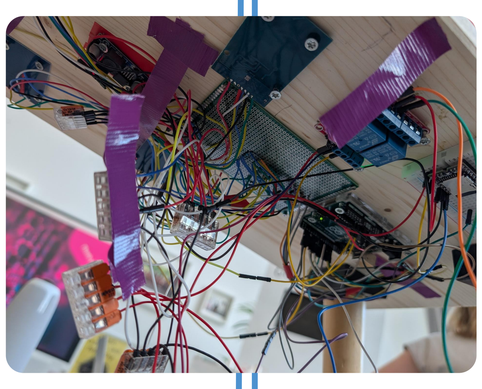

1D Craft a miniature document tray for the CV's

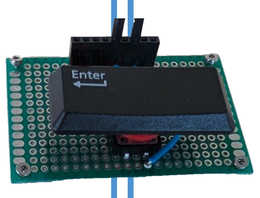

You can freestyle this step. The bottom dimensions must match a minimum of what is shown in the following figure and the side walls dimensions can be chosen individually.

1E Wire & solde the whole pinout according to the pin layout in appendix xy.

→ **Take care of the following pitfalls:**

- To long cables at the nfc readers (especially at the xy pins) lead to unreliable data communication à for us 20cm long cables was the maximum
- Before soldering all the cable to the nfc reader, make sure, that your nfc readers have strong enough signals, that they recognize nfc tags through the tabletop.
- The nfc readers must be attached directly underneath the engraved rectangles
